

HI3810 Dissolved Oxygen

HI3810 Dissolved Oxygen Test Kit

The Hanna dissolved oxygen portable test kit can determine the oxygen concentration in water quickly and easily. A modified Winkler method is used. Manganous ions react with oxygen in the presence of potassium hydroxide to form a manganous oxide precipitate. When acid is added, manganese oxide oxidizes the iodide to iodine. The amount of iodine generated is equivalent to the oxygen in the sample, the concentration of iodine is calculated by titration of thiosulfate ions that reduce the iodine back to iodide ions.

HI3833 Phosphate

HI38054 Ozone Test Kit

The Hanna test kit for ozone determines the ozone concentration in water via Checker® disc. The reaction between ozone and the reagent causes a pink tint in the sample which is proportional to the ozone concentration.

Phosphate Test Kits

The orthophosphate level in mg/L (or ppm) is determined by a colorimetric method. Ammonium molybdate and potassium antimonyl tartrate react in an acidic medium with orthophosphate to form a phosphomolybdate complex; this complex is reduced to intensely colored molybdenum blue by ascorbic acid. The color intensity of the solution determines the phosphate concentration. The Hanna Phosphate Test Kit will only determine orthophosphate levels.
